

## **Gradual Progress on Structural Readjustment in Cement Industry**

The structural readjustment in China cement industry has achieved some successes gradually by accelerating the elimination of backward production capacity, technical reconstruction and recombination. About 340 million tons of backward production capacities have been eliminated in China, Ms. Zeng Xuemin, vice president of China Cement Association, said in a recent interview.

Ms. Zeng also expressed that during the Eleventh-Five Period, energy saving and emission reduction has achieved great success in cement industry. However, unbalanced regional development, short industry chain, poor ability of risk resistance and corporate management still exist and need to be improved.

Look forward to The Twelfth-Five Period, cement industry is facing a valuable opportunity for development. Ms. Zeng said our work should be focused on industry structure optimization, energy saving and emission reduction, merger and restructuring, etc. In all, comprehensive utilization of resources and environment-friendly development should be the main task of all cement corporations.
